

Impact of Row / Column Storage on Analytics

Example query: what is the average product price?

Row-based storage

Product	Price	Availability
Apples	\$5	High
Oranges	\$3	High
Pears	\$11	Low

Data is scanned sequentially per row.

Calculating the average requires a full table scan

Columnar storage

Products	Price	Availability
Apples	\$5	High
Oranges	\$3	High
Pears	\$11	Low

Calculating the average requires only one column to be scanned
